

PATIENT FACT SHEET

Methotrexate (Rheumatrex, Trexall, Otrexup, Rasuvo)

WHAT IS IT?

Methotrexate is one of the most effective and commonly used medications in the treatment of rheumatoid arthritis (RA) and other forms of inflammatory arthritis. It can also be used to treat lupus, inflammatory myositis, vasculitis, and some forms of childhood arthritis. It's often used in

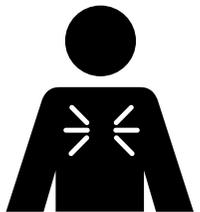

combination with other medications to treat RA. It's known as a disease-modifying anti-rheumatic drug (DMARD), because it not only decreases the pain and swelling of arthritis, but it also can decrease damage to joints and long-term disability.

HOW TO TAKE IT

Methotrexate comes either as pills or as a subcutaneous injection. Methotrexate is usually taken as a single dose once per week to improve absorption or avoid side effects; occasionally the dose is split into two doses. Your doctor also may prescribe a folic acid (or folate) vitamin supplement to decrease the chance of side effects. Methotrexate should not be taken if kidney or liver function is not normal. Alcohol significantly increases

the risk for liver damage while taking methotrexate, so alcohol should be avoided. Regular laboratory monitoring is required to monitor blood counts and your liver while taking methotrexate. Improvements in arthritis and other conditions usually are first seen in 3-6 weeks. The full benefit of this drug may not be seen until after 12 weeks of treatment.

SIDE EFFECTS

You should contact your doctor if you develop symptoms of an infection, such as a fever or cough, or if you think you are having any side effects. If you develop symptoms of an infection while using this medication, you should stop it and contact your doctor. The most common side effects are gastrointestinal upset and elevations of liver function tests. About 1-3% of patients develop mouth sores (called stomatitis), rash, diarrhea, and abnormalities in blood counts. Some side effects do not cause symptoms, so it is important to have routine blood tests performed every 8-12 weeks. Methotrexate may cause cirrhosis (scarring) of the liver,

but this side effect is rare and most likely to occur in patients who already have liver problems or are using alcohol or taking other drugs that are toxic to the liver. Lung problems (persistent cough or unexplained shortness of breath) can occur rarely when taking methotrexate. Slow hair loss is seen in some patients, but hair grows back when the person stops taking this medication. This can often be managed by taking folic acid. It is important to remember that most patients do not experience side effects, and that, for those who do, many of the minor side effects will improve with time."

TELL YOUR DOCTOR

You should contact your doctor if you develop symptoms of an infection, such as a fever or cough, or if you think you are having any side effects. Be sure to let your doctor know if you are pregnant, planning to get pregnant, or if you are breastfeeding. Methotrexate treatment should be discontinued for at least three months before attempting to become

pregnant. Even though methotrexate should not be taken during pregnancy, it does not reduce a woman's chance of becoming pregnant in the future. Men taking methotrexate should talk to their physician prior to attempts to conceive. If you are planning on having surgery, or will be receiving chemotherapy or radiation therapy, talk to your doctor first.
